

A medium logistics firm cuts picking-list time by 91.6%: Finance and administration

LOGISTICS AND TRANSPORTATION

MEDIUM

FINANCE AND ADMINISTRATION

-91.6%

PICKING-LIST TIME [1]

-89.9%

VERIFICATION TIME [1]

100%

BOT TEST ACCURACY [1]

PROBLEM

Manual shipment tracking, picking-list creation, and row-level verification consumed time and produced inconsistent accuracy at volume. Repetitive data work limited the capacity available for exceptions and customer needs.

SOLUTION

The company built three focused bots, compared them with manual work, and simplified inbound and outbound workflows. Each bot addressed a defined task so the team could test speed and accuracy against the existing method.

RESULT

Picking-list time fell from 90 seconds to 7.6 seconds. Verification time fell by 89.9% on average, and bot accuracy reached 100% in the reported tests.

BUSINESS LENS

Process economics: focused automation reduced repetitive unit effort while preserving a defined process boundary.

ASSUMPTIONS AND LIMITS

Single anonymous company, limited delivery-note dataset, no employee count, and no long-term evaluation. Some high-volume values were forecasts.

DEPARTMENT APPLICATION

FINANCE AND ADMINISTRATION

Lower unit effort released staff capacity.

Application analysis based on the cited source. It is not a separate measured result.
